Choosing the Right Job Title

Data Scientist

Having read tens of job descriptions for various job titles including: Junior Data Scientist, Data Scientist, Data Engineer, Data Analyst, Marketing Analyst, Junior BI Analyst amongst others, I have concluded that 'Data Scientist' is the job title for me. A job title is, in most cases, a quick way to know what kind of work you'll be doing, what will be expected of you as a person, and what technical skillset you are required to have. Thus, given that I enjoy a Data Science role much more than a Data Analyst or Data Engineer role, and am much happier doing Data Science work it only makes sense to choose this as the 'right job title'. I could go into more detail to justify this choice, however since the goal of this exercise is to in part open up what opportunities I consider/help me find my path (and I have already done those things) I am happy to report I know what I want 😊
